QUICKCART CASE STUDY

Dashboard Reading Guide

A visual-by-visual guide to the Delivery, Support & Refund Performance dashboard: what each chart shows and what it tells us.

Live dashboard: https://quickcart-casestudy.streamlit.app/

Data: 01 Jan – 25 Mar 2026 · 6,200 orders · 5,200 support tickets (after cleaning)

How to Use the Dashboard

- **Admin View / Customer View:** the switch at the top right. Admin View is this leadership dashboard; Customer View is the customer help centre with the support chatbot.
- **Filters (left sidebar):** courier, product category, city, payment method and month. They apply to every tab; 'Reset All Filters' restores the full data.
- **Tabs:** Overview, Courier Performance, Support & CSAT, Refund Leakage, Insights, Data Explorer and Data Quality.
- **Interactive charts:** hover any bar, tile or point for exact values. Click a treemap tile to drill in. Some cards have buttons to switch what the chart breaks down by.
- **Data Explorer:** type an order or ticket ID to see its full record and whether its refund followed policy; tables can be searched and downloaded.

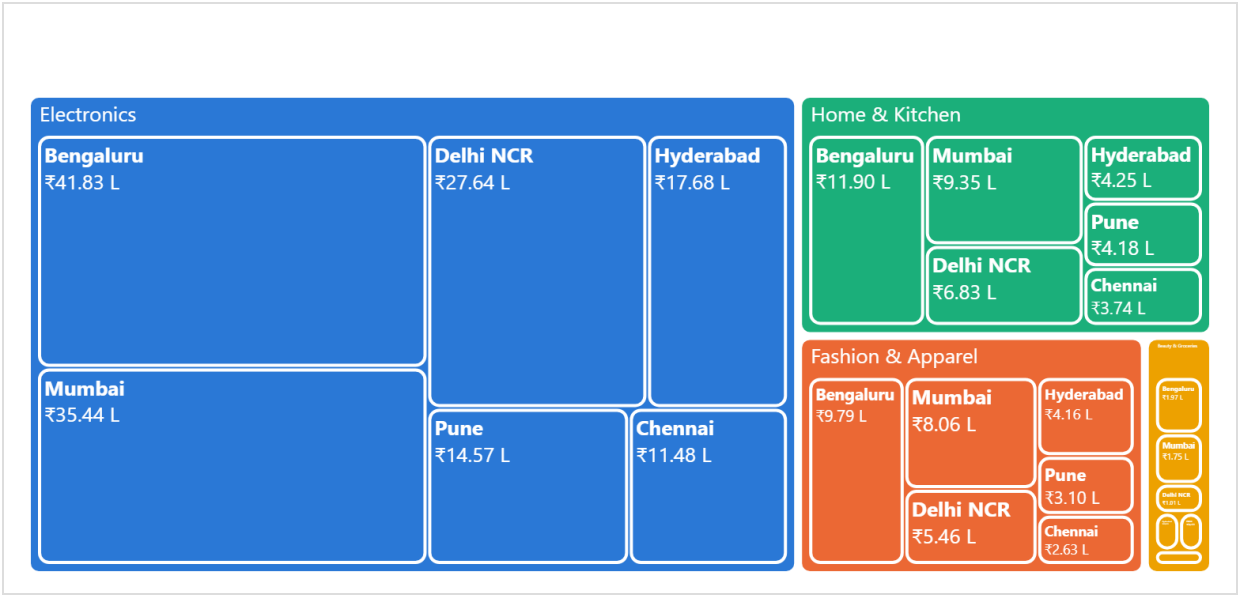

Headline Cards (top of every tab)

Card	What it means
Total Orders	Unique orders placed in the period (6,200).
Support Tickets	Unique support tickets raised (5,200).
Total Order Value	Gross merchandise value: sum of order amounts, excluding shipping (₹2.29 Cr).
Total Refunds	Money paid back as refunds and vouchers (₹1.00 Cr, about 44% of order value).
Avg Resolution Time	Average hours from a ticket being raised to being resolved (24.6 h).
Policy Leakage	Refunds paid above what the refund policy allows (₹4.68 L across 149 tickets).

1. Overview

Cards on this tab: order value with and without shipping or cancellations, refund rate, ticket rate, average order value, active customers, open tickets and total refunds issued.

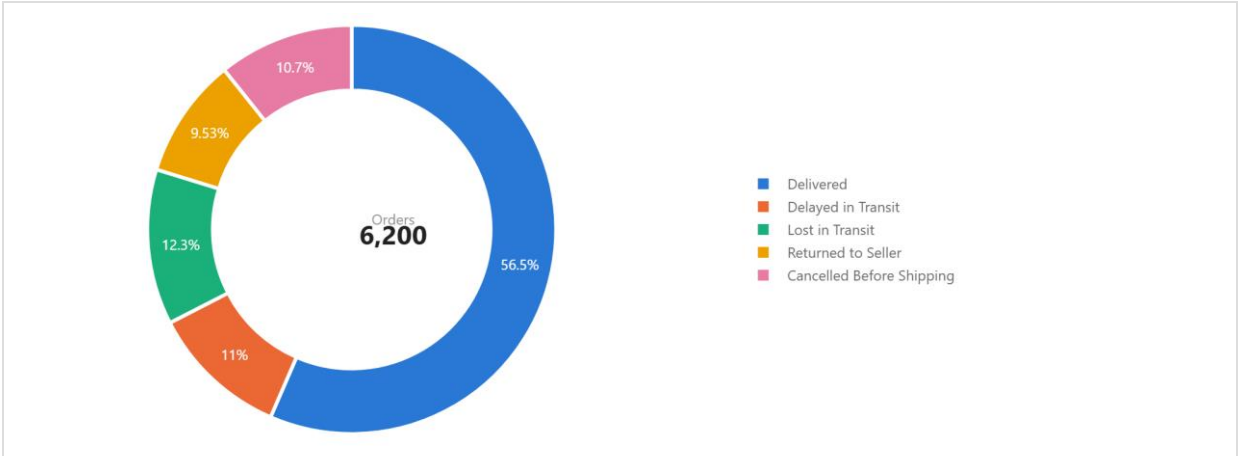

Order Value by Category and City

What it shows: Each tile is a slice of total order value, grouped by product category and then by city; bigger tiles mean more value. Click a category to drill in.

Key takeaway: Electronics is about 65% of all order value, and Bengaluru and Mumbai lead in every category.

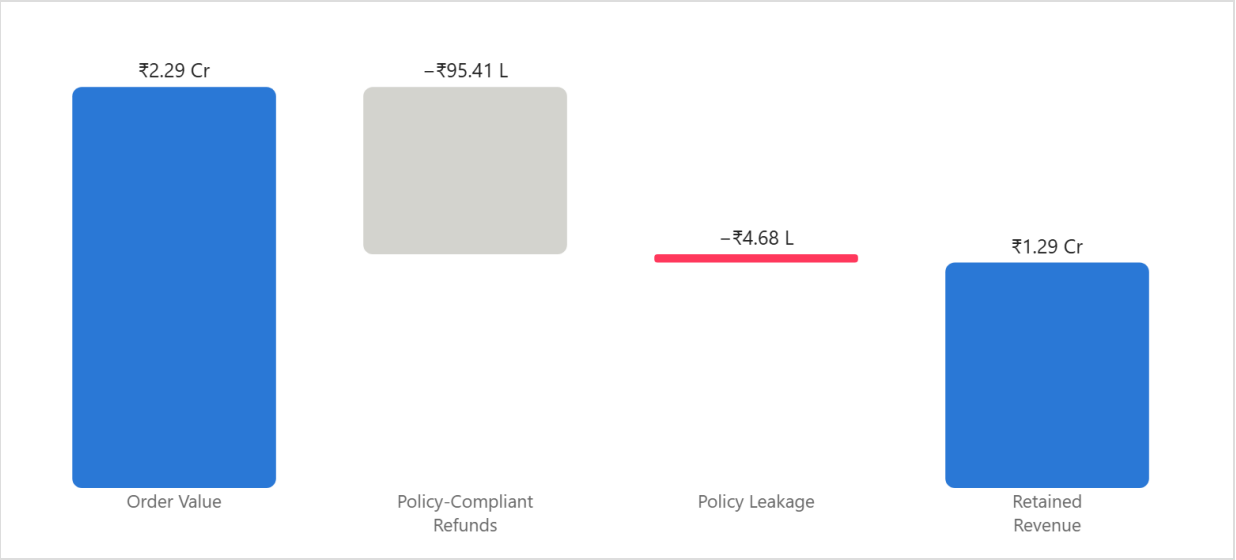

Delivery Outcomes

What it shows: The share of all orders by their final delivery status.

Key takeaway: Only 56.5% of orders are delivered normally: 12.3% are lost, 11.0% delayed, 10.7% cancelled before shipping and 9.5% returned to the seller.

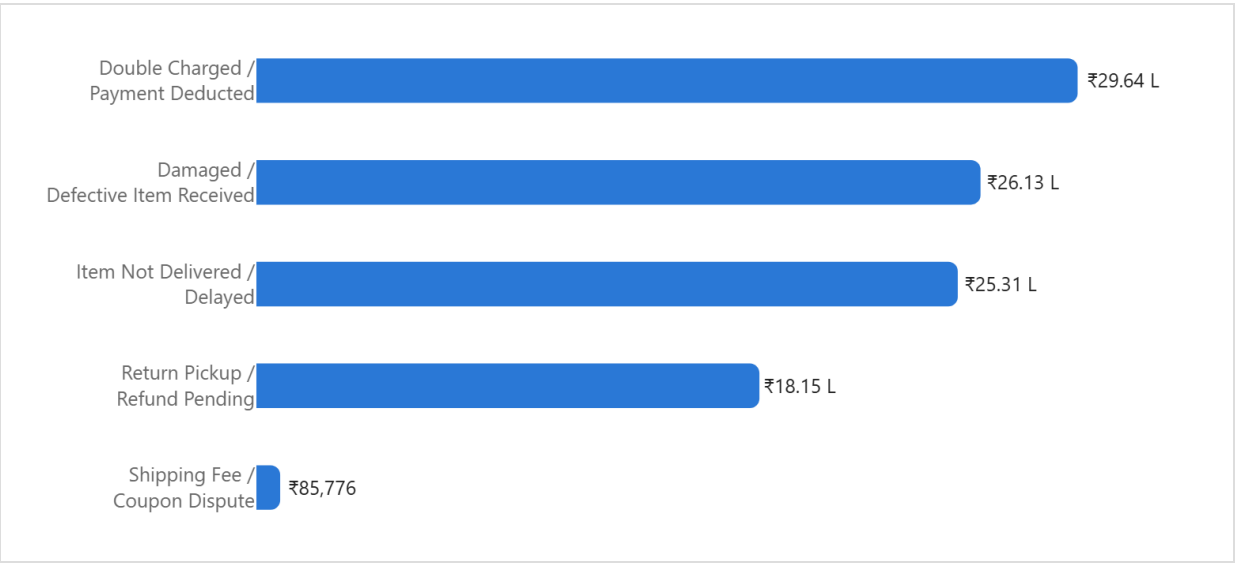

Order Value to Retained Revenue

What it shows: Starts from total order value, subtracts refunds that followed policy (grey) and refunds that broke policy (coral), and ends at the revenue QuickCart keeps.

Key takeaway: Refunds take about 44% of order value, leaving ₹1.29 Cr; the ₹4.68 L coral slice is money paid out against policy.

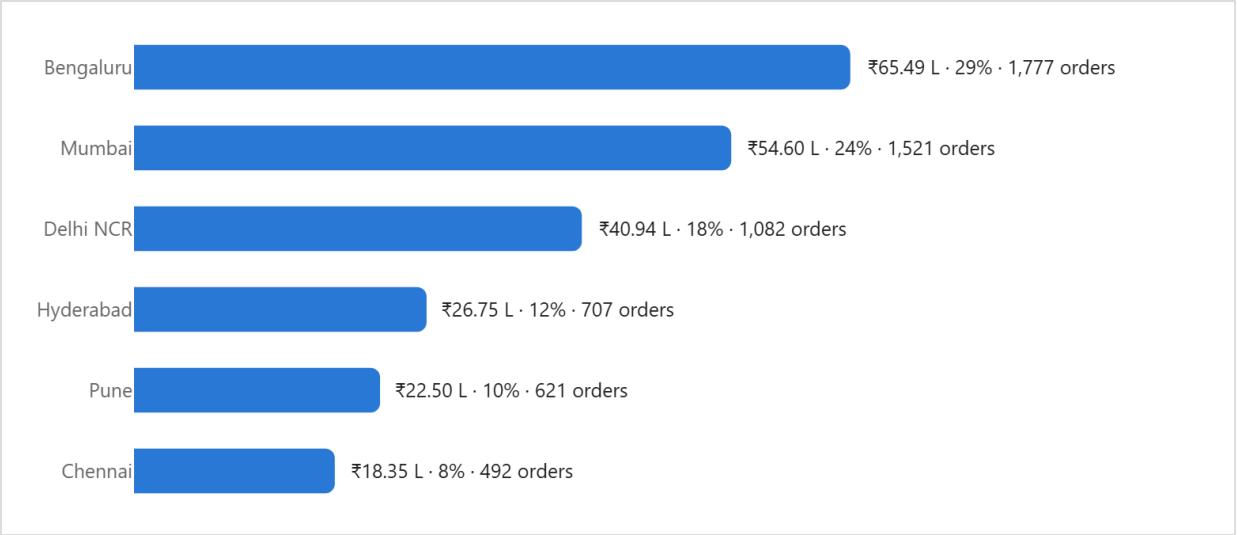

Refunds by Issue Type

What it shows: Total refund value by the type of complaint the customer raised.

Key takeaway: Double charges (₹29.64 L) and damaged items (₹26.13 L) cost the most; shipping-fee disputes are negligible.

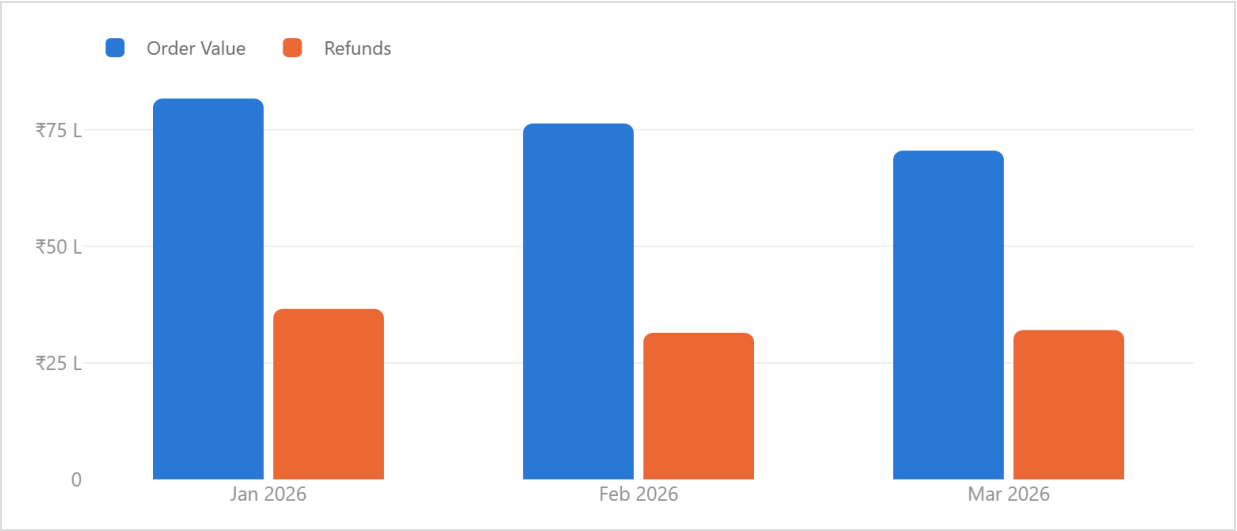

Order Value Breakdown

What it shows: Order value split by a dimension you choose (City, Product Category, Courier Partner or Payment Method), with each bar's share and order count. The image shows the City view.

Key takeaway: Bengaluru brings 29% of order value; switching views shows UPI is 56% of value and Shadowfax_Local carries 39%.

Order Value vs Refunds by Month

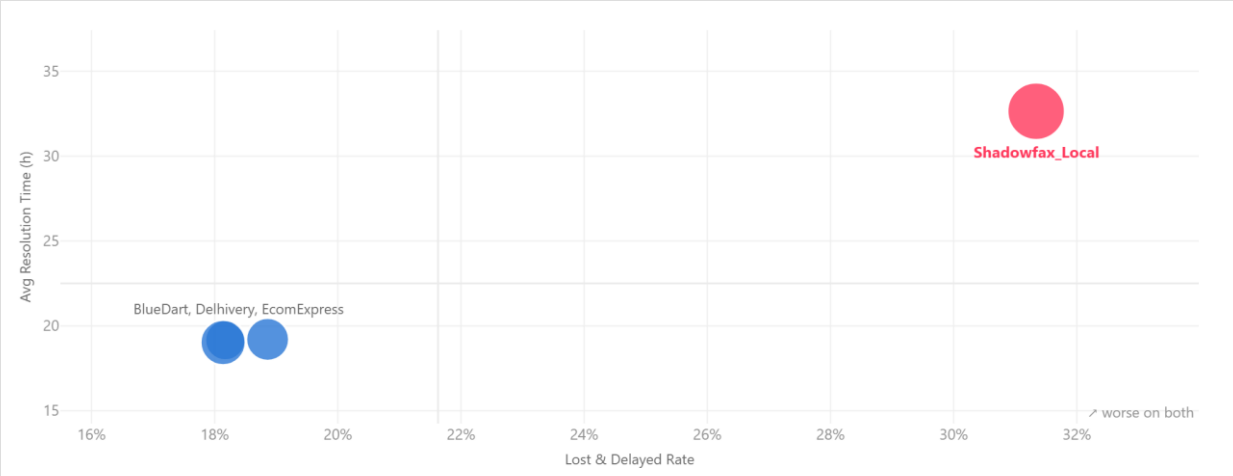

What it shows: Total order value and total refunds for each month side by side.

Key takeaway: Refunds stay at roughly 40–45% of order value every month. March looks lower only because data ends on 25 March.

2. Courier Performance

Compares the four courier partners on delivery failures and how long their tickets take to resolve.

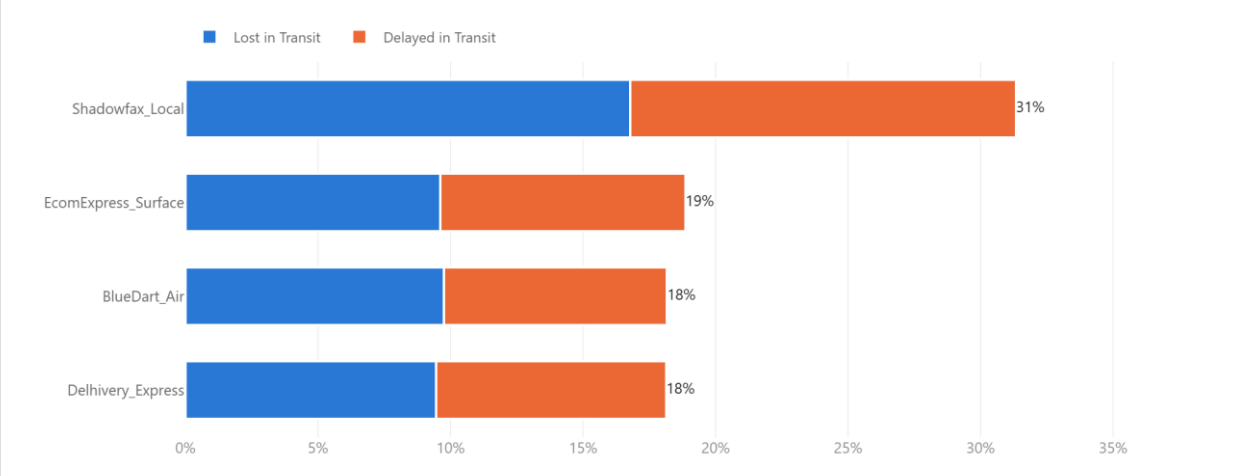

Delivery Failures vs Resolution Time

What it shows: Each bubble is a courier: further right means more lost or delayed orders, higher means slower ticket resolution, and bubble size is order volume. The lines mark the courier average.

Key takeaway: Shadowfax_Local sits alone in the 'worse on both' corner; the other three cluster around 18% and 19 hours.

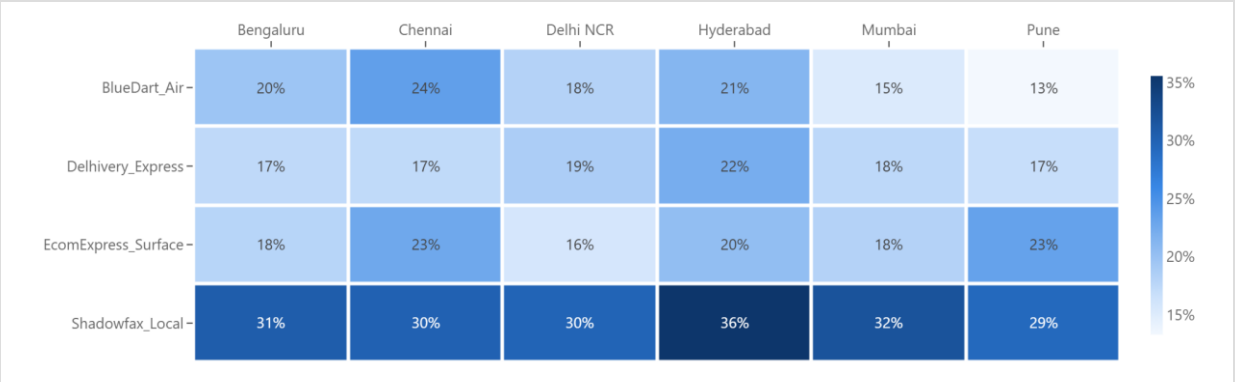

Lost & Delayed Rate

What it shows: The share of each courier's orders that were lost (blue) or delayed (orange) in transit.

Key takeaway: Shadowfax_Local fails 31.3% of its orders, against 18.1–18.9% for the others.

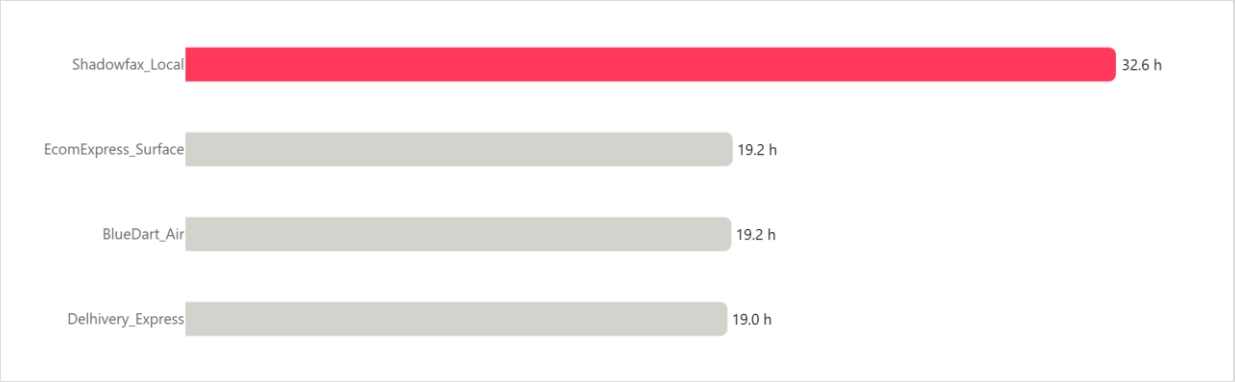

Lost & Delayed Rate by Courier and City

What it shows: The lost and delayed rate for every courier and city combination; darker cells mean more failed deliveries.

Key takeaway: Shadowfax_Local's row is dark in every city, so this is a courier problem, not a regional one.

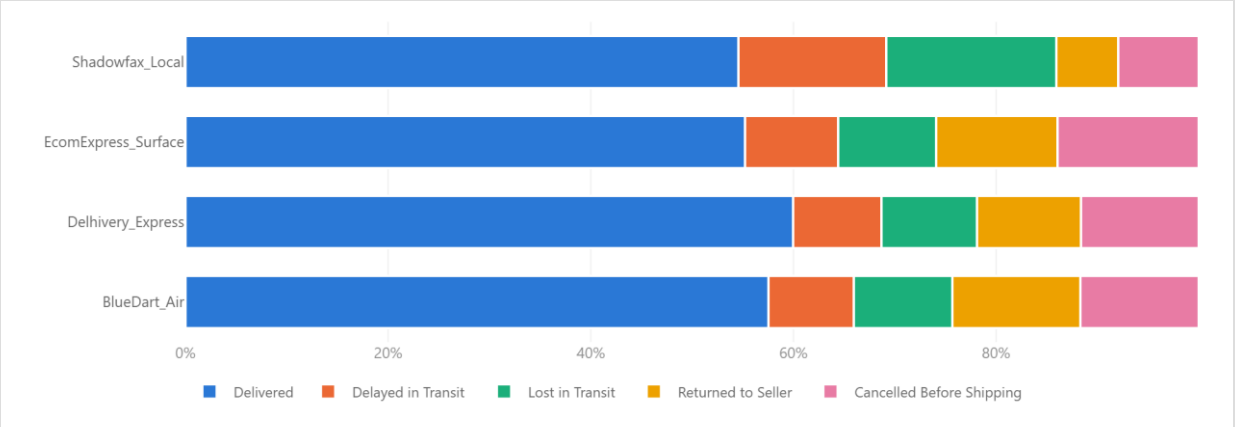

Avg Resolution Time by Courier

What it shows: Average hours to resolve a support ticket, by the courier that shipped the order.

Key takeaway: Shadowfax_Local tickets take 32.6 hours, against about 19 hours for the other couriers.

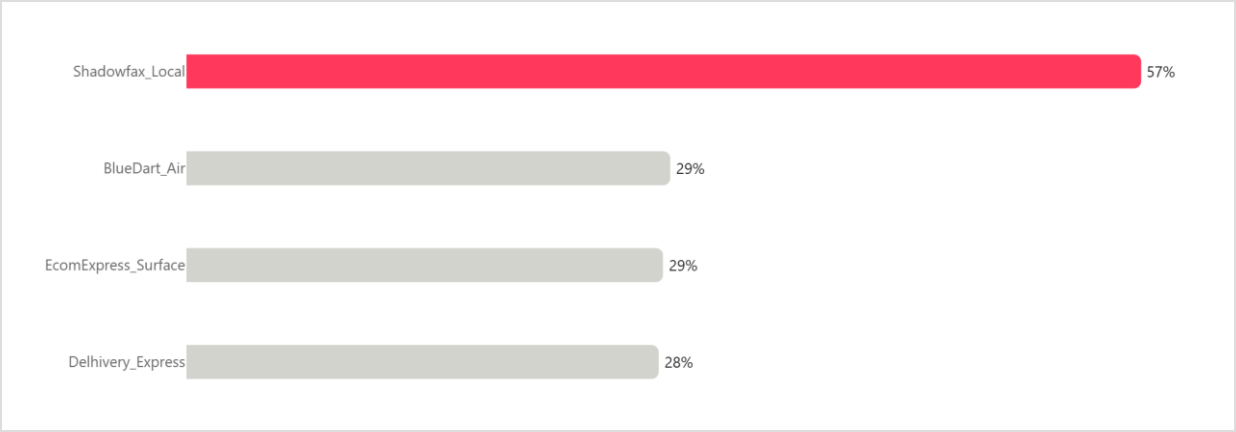

Delivery Status Mix by Courier

What it shows: How each courier's orders split across all five delivery outcomes.

Key takeaway: Shadowfax loses and delays more, but the other couriers return about twice as many orders to the seller (10–12.6% vs 6.2%).

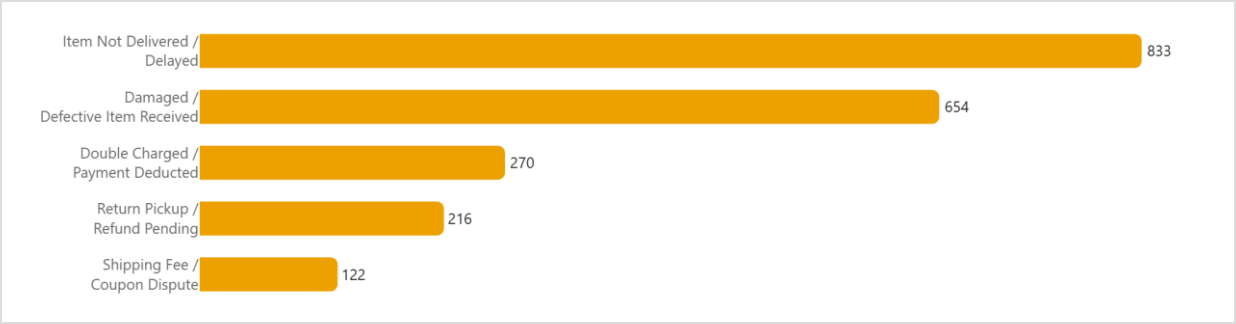

Tickets Resolved After 24 Hours

What it shows: The share of each courier's resolved tickets that took longer than 24 hours; each one qualifies for a ₹100 late voucher.

Key takeaway: 57% of Shadowfax_Local tickets miss the 24-hour target, double the other couriers (28–29%).

Courier Deep-Dive

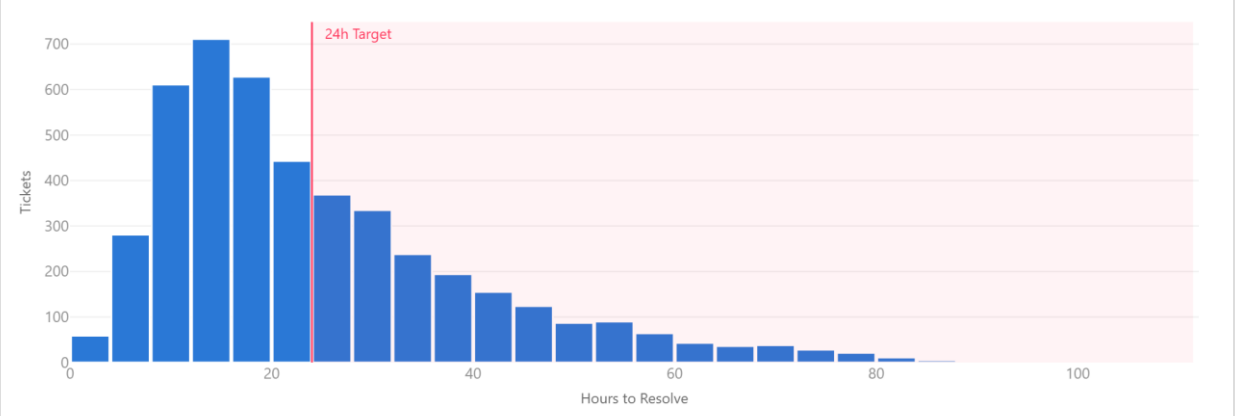

What it shows: Pick a courier to see its own numbers and its complaint mix. The image shows Shadowfax_Local, the default selection.

Key takeaway: Most Shadowfax_Local tickets are 'not delivered / delayed' (833) and 'damaged' (654). Below this card, a scorecard table lists every courier metric side by side.

3. Support & CSAT

Cards on this tab: average and median resolution time, share resolved after 24 hours, open tickets and average CSAT with its response rate.

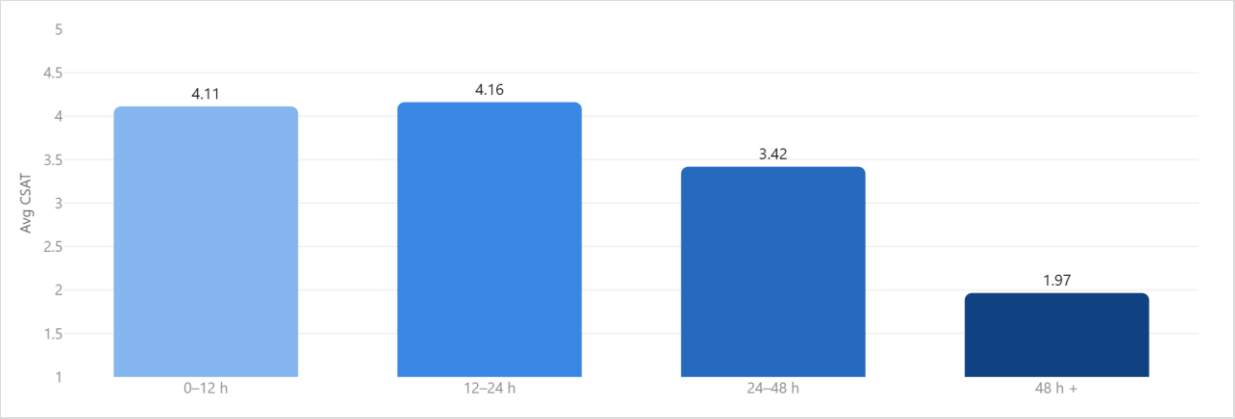

Ticket Resolution Time

What it shows: How many tickets were resolved within each band of hours; the shaded zone is beyond the 24-hour target.

Key takeaway: Most tickets close within a day, but 40.3% fall in the shaded zone, with a long tail beyond 48 hours.

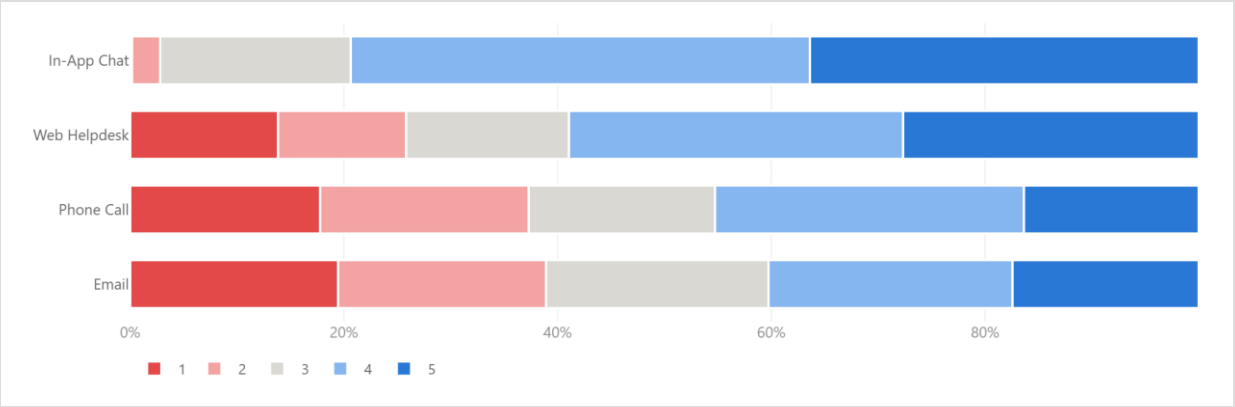

CSAT by Resolution Time

What it shows: Average customer satisfaction (out of 5) by how long the ticket took to resolve.

Key takeaway: Satisfaction holds above 4 within 24 hours, then falls to 3.42 at 24–48 hours and 1.97 beyond 48 hours.

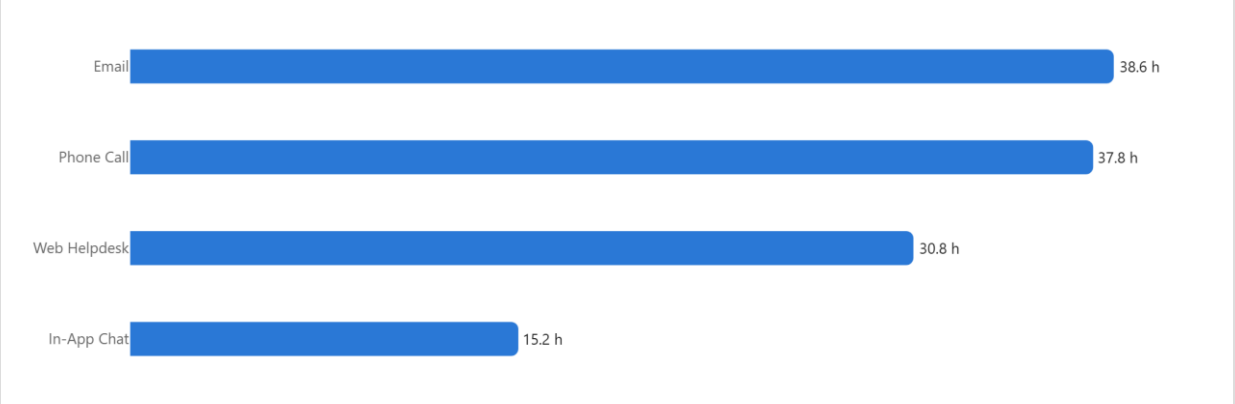

CSAT Rating Mix by Channel

What it shows: How each support channel's ratings split from 1 (red, unhappy) to 5 (blue, happy).

Key takeaway: In-app chat has almost no unhappy ratings; email and phone have the most 1s and 2s.

Avg Resolution Time by Channel

What it shows: Average hours to resolve a ticket on each support channel.

Key takeaway: Email (38.6 h) and phone (37.8 h) take more than twice as long as in-app chat (15.2 h).

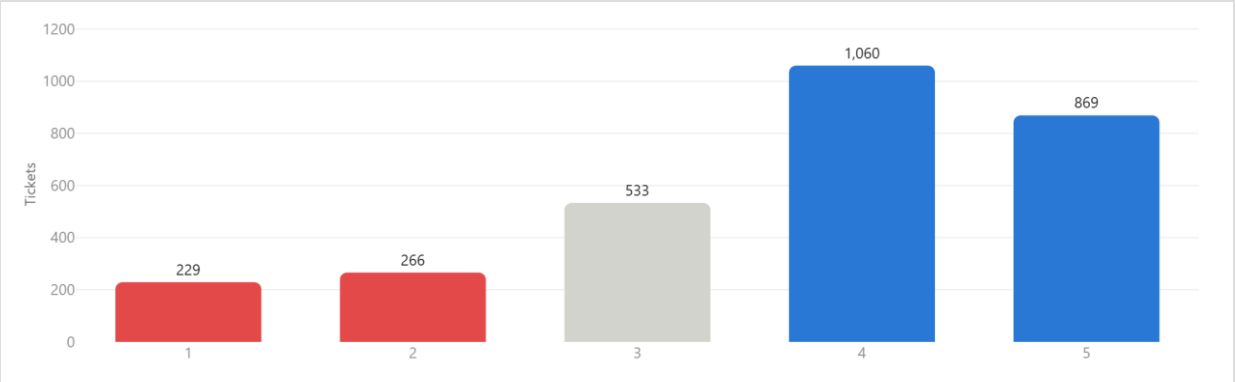

Open Ticket Backlog

What it shows: The 582 still-open tickets by issue type and courier; darker cells hold more open tickets.

Key takeaway: Shadowfax holds the largest backlog, especially 'item not delivered / delayed' (98 tickets).

CSAT Rating Distribution

What it shows: The number of tickets that received each rating from 1 to 5.

Key takeaway: Most customers rate 4 or 5, but about 495 gave a 1 or 2, and 43% of customers don't rate at all.

4. Refund Leakage

Refunds paid above what QuickCart's refund policy allows. Cards: tickets over-refunded (149), total leakage (₹4.68 L) and its share of all refunds (4.7%). An expandable table on this tab explains how each rule is measured.

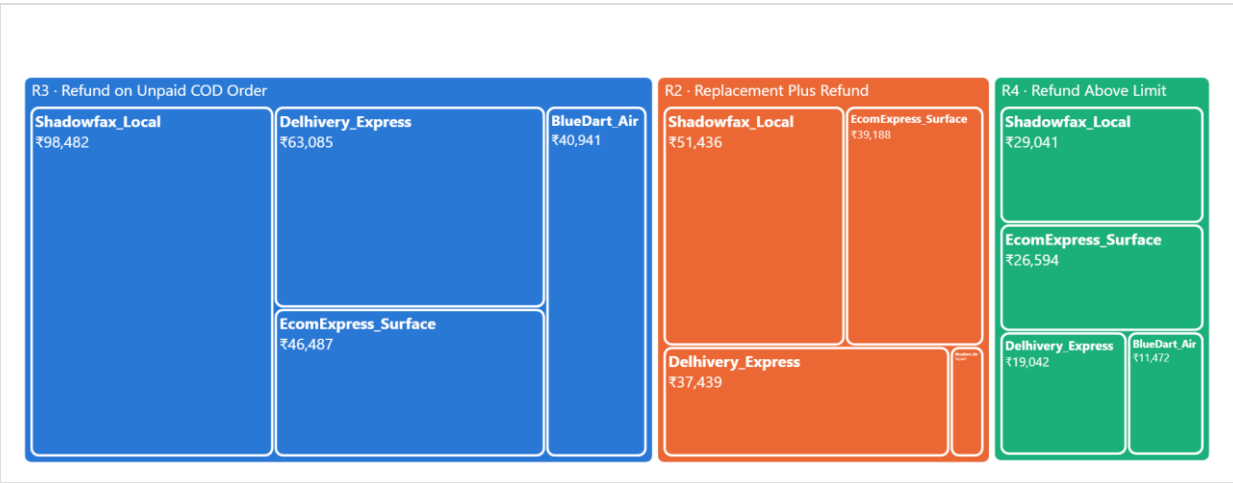

Leakage by Policy Rule

What it shows: Adds up the over-paid amount from each broken rule to reach the total leakage; labels show the ticket count per rule.

Key takeaway: Refunds on unpaid COD orders (R3) leak the most, ₹2.49 L, followed by replacement plus refund (R2) at ₹1.33 L.

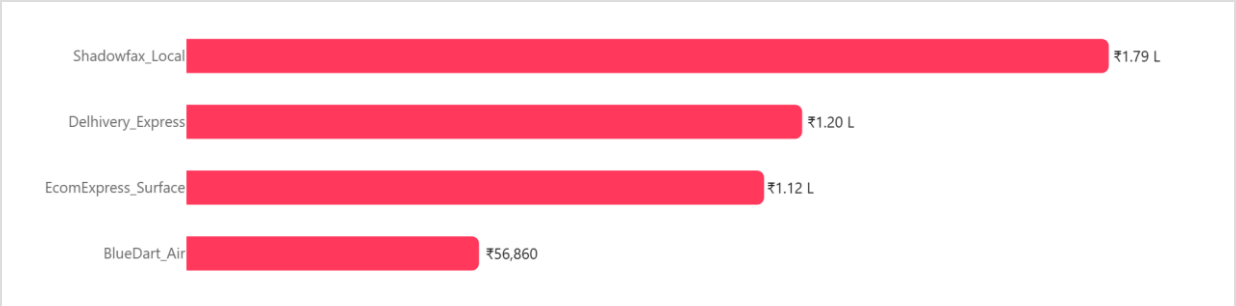

Leakage by Rule and Courier

What it shows: Leaked money by rule, split by the courier that shipped each order; tile size is the amount. Click a rule to drill in.

Key takeaway: Shadowfax_Local is the largest piece within most rules.

Leakage Breakdown

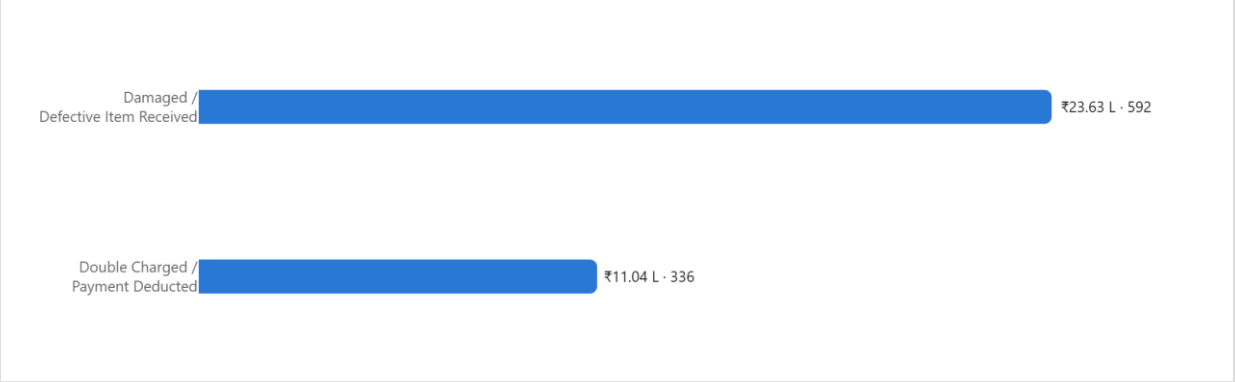

What it shows: Leaked money split by a dimension you choose (courier, category, channel, issue or city). The image shows the Courier view.

Key takeaway: Shadowfax_Local accounts for ₹1.79 L of leakage. Below this card, a filterable table lists every over-refunded ticket with a CSV download.

5. Insights

Cards on this tab: refunds on delivered orders (928), off-policy vouchers (109), late-voucher exposure (₹1.85 L) and the CSAT drop on slow tickets (1.97 vs 4.14).

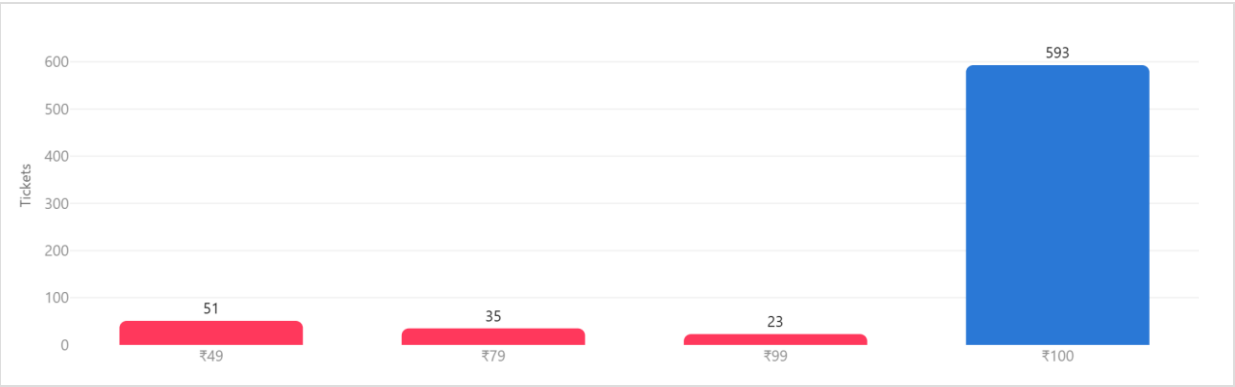

Full Refunds on Delivered Orders

What it shows: Full refunds paid on orders the courier marked as delivered, by issue type, with value and ticket count.

Key takeaway: ₹34.66 L went out this way: ₹23.63 L for damage claims and ₹11.04 L for double charges, which need payment and proof-of-delivery checks.

Apology Voucher Amounts

What it shows: How many apology vouchers were given at each amount; the policy amount is ₹100 (blue).

Key takeaway: 109 vouchers were ₹49, ₹79 or ₹99 (coral), matching shipping fees rather than the ₹100 policy.

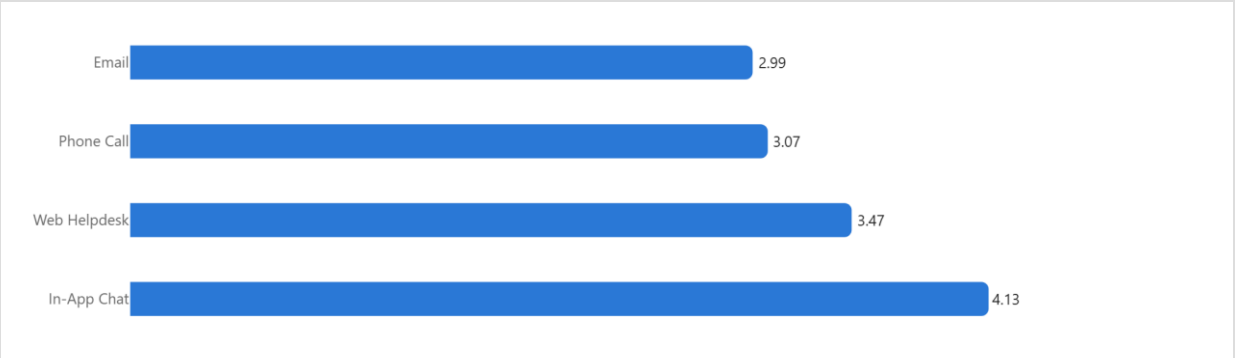

Ticket Rate by Category

What it shows: How often an order in each product category turns into a support ticket.

Key takeaway: All categories sit at 83–85%, so no single product category is the cause.

Avg CSAT by Support Channel

What it shows: Average customer satisfaction on each support channel, out of 5.

Key takeaway: In-app chat scores 4.13 while email (2.99) and phone (3.07) lag, mirroring how slow those channels are.

6. Data Quality

How the raw files were cleaned before analysis. The tab also lists every issue found in each file and the fix applied.

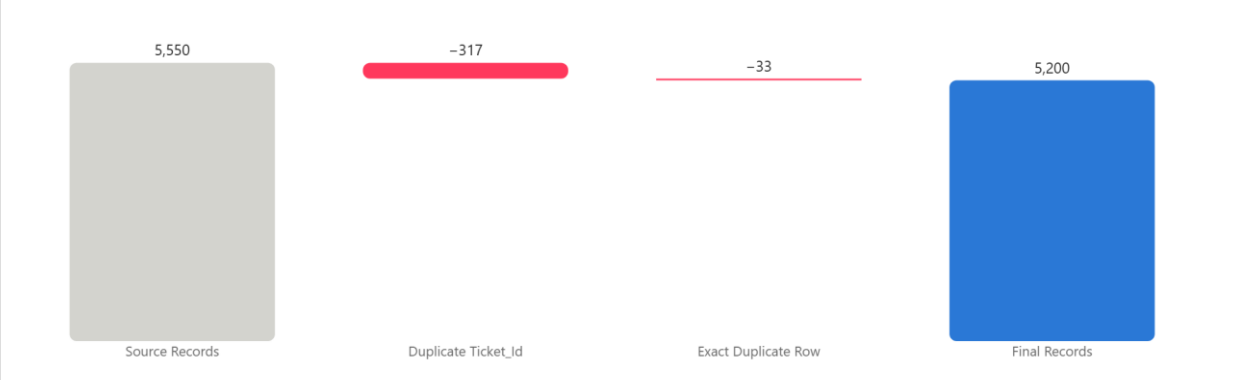

Orders: 6,500 → 6,200 Records

What it shows: Starts from the raw order rows and removes each type of bad record to reach the clean total.

Key takeaway: 233 re-formatted duplicates, 45 test records and 22 exact duplicates were removed.

Support Tickets: 5,550 → 5,200 Records

What it shows: The same reconciliation for the support-ticket file.

Key takeaway: 317 re-formatted duplicates and 33 exact duplicates were removed.

7. Customer View (Help Chatbot)

Switch to Customer View at the top right. A customer signs in with their customer ID, or picks a demo customer, and sees:

- **Profile cards:** number of orders, total spent, open tickets and customer since.
- **Your orders:** each order with its delivery status and a 'Get help with this order' button.
- **Help assistant:** ask in your own words or tap a quick question. The assistant looks up the real order, applies QuickCart's refund rules and offers an instant action such as a refund, replacement or ₹100 voucher, with a reference number.
